ELC Systems Communications allows you to interface the best fluid power products with your PLC, or PC. If you've been searching for a simple, direct and inexpensive path to electronic orchestration of your machine assembly process, then consider ELC.

- Do away with Hardwiring Headaches! Circuit boards replace traditional wiring. Simple manifold-to-manifold connections.
- Split Stack Capabilities. Separate valves into two or more banks, but still control them over one cable from the PLC, without starting a second node (16-solenoids maximum).
- No BIG Control Box at the end of each valve stack. A MAJOR cost & space savings.
- Three Levels of Communication: Parallel, Serial Interface and DeviceNet™.
- Surge suppression for every solenoid-standard.

#### **AroNet™ DeviceNet**

- Fully DeviceNet Compatible.
- Split Stack Wiring Capability on Alpha & Genesis.
- Controls up to 16 Solenoids/Inputs per node.
- Start a second node in the middle of a valve stack. (Genesis only)
- Add/Remove Valves in Minutes.
- External Power Available.
- Available for Genesis, Alpha and Sierra Valves.
- Available with Interceptor Input Block

## **AroLink™ Serial Interface**

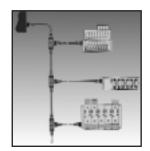

- Controls up to 16 Solenoids/Inputs per Wire.
- Works with ANY make Discrete Output PLC.
- Quick, Single-to-Double Solenoid Conversion.
- Split Stack Wiring Capability.
- Compatible with Omron® Link Terminals, or direct connection to Omron PLC's (B7A language).
- · Available for Genesis, Alpha and Sierra Valves.
- Available with Interceptor Input Block.

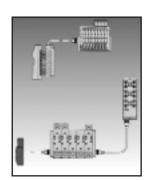

#### **AroCom<sup>™</sup> Parallel**

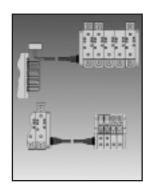

- Controls up to 15 Solenoids.
- Add/Remove Valves in Minutes.
- Split Stack Wiring Capability.
- Very Low Power Draw with Aro Low-Watt Solenoid.
- Easy Single-to-Double Solenoid Conversion.
- Available for Genesis and Alpha Valves.
- Operates off TTL (3.4V) to 24V Signal.

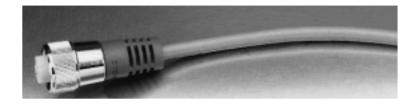

AroLink and AroNet (DeviceNet) Systems carry signals to valve stacks over this small cable; eliminating the need for clumsy bundles of direct connection wires - dramatically reducing both space consumption and your valuable installation time. AroCom system is controlled over a cable.

# **ELC Systems for Genesis Valves**

- Available in AroNet, AroLink and AroCom configurations. For use with *Plug-In* Valves.
- ELC intelligence is located within the manifold raceway.
- The first manifold requires an AroNet or AroLink smart card. Other manifolds use AroCom driver cards, including split stack manifolds.

# **ELC Systems for Alpha Valves**

- Available in AroNet, AroLink and AroCom configurations. For use with Stacking or Thin Valves.
- ELC Intelligence is located within the valve raceway.
- The first valve requires an AroNet or AroLink smart card. Other valves use AroCom driver cards, including split stack valves.

# **ELC Systems for Sierra Valves**

- Available in AroNet and AroLink configurations. For use with any Sierra body style.
- ELC intelligence is located within the manifold assembly.

# Interceptor™ Input Block

#### Interceptor™ Input Block

- Allows Multiple 24V DC Sensors to Communicate on One Cable.
- Features 12mm 4-Pin Connectors or Watertight Compression Fittings.
- Modular Design consists of one Command Module (AroLink or AroNet) and as many Sensor Modules as required; in packs of 4 Inputs, up to 16 Inputs total.
- Additional Modules can be quickly added/removed from the system.

2"	119897-20	4"	119897-40

NOTE: Order bracket and switch separately.

#### **Hall Effect Switchs**

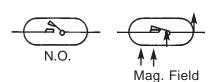

It is important to note that Hall Effect switches must always have current through them to work. In a magnetic field, the semiconductor generates a voltage across the sense leads. Removing the magnetic field returns the switch to its normally open state. Hall effect switches have 'three wire' leads. Black leads are sinking (NPN). Grey leads are sourcing (PNP). Load is controller. There are two types of Hall Effect switches. Each is connected differently. Check your PLC for the input method used. Sinking (NPN) will sink current to ground. Sourcing (PNP) will provide current from the +VDC.

NOTE: Operating temperature is 14 - 140° F and the environmental rating is IEC IP 67 in all three switch types. Std. Red LED requires min 18 mA.

#### **Reed Switchs**

Switch is normally open, load can be attached to BROWN or BLUE lead. The BROWN lead is the higher potential side of the switch. In a magnetic field, the two reeds are brought into contact to "make" the circuit. Reed switches have black, 'two wire' leads.

(Group 2 only slave)

**Bit Mapping Reservations:** 16 Bit output word, additional enable bit dependent upon DeviceNet scanner/PLC interfacing..

## **Series TN**

- Fully Repairable
- NFPA Interchangeable
- Infinite Resolution
- Factory Lubricated
- · Factory Installed mounts or,
- Customer Installed mount kits

The Linear Resistive Transducer probe is completely inside the cylinder piston rod. There are no external parts (except the connector), therefore, the Provenair LRT is NFPA interchangeable. A floating contact, attached to the piston moves along the resistive and collector strips on the probe as the cylinder reciprocates. The linear resistance directly proportions the output voltage, indicating the position of the contact. Using a controller with an Analog card, cylinder position can be infinitely determined. Cylinder position can be controlled using a proportional valve. Accuracy is affected by 3 factors:

**Resolution** is the smallest detectable position change measurable. The Provenair LRT is infinite, thus the Resolution is limited by the electronics used (a 12-bit, 4096-part controller would divide the stroke into 4096 parts. Using 10 VDC input voltage, the smallest detectable increment on a 10" stroke will be  $10 \div 4096 = 2.4$  millivolt = 0.0024").

**Linearity** is the reference to the maximum deviation of the output voltage to a straight line. The Provenair linearity is  $\pm 0.5\%$  of stroke.

**Repeatability** is the LRT ability to output the same voltage at each unique position every time. The Provenair LRT repeatability is  $\pm 0.0001$ ".

# Performance Specifications

Dimensional Data

Stroke: 600mm Max.

Rod Diameter: 5/8" or 1"

Resolution: Infinite

Nonlinearity 1.0% (or less) of full stroke

Signal: 0-30VDC

# **Aro Pneumatic Logic Control Overview**

**Elements:** Elements are miniature diaphragm operated poppet valves designed to perform specific functions. This includes "Or," "And," "Not," plus various "Memory" and "Delay" functions. Elements are designed so response times, shift ratios, flow and exhaust capacities are closely matched and all are compatible in a total system. This compatibility simplifies circuit design.

Circuit Board Construction: Aro's patented circuit board construction uses a gasket and two metal plates to create a custom air manifold. Interconnections between the elements are cut into the gasket (module) and sealed between the metal plates. The result is a completely interconnected circuit without tubing or fittings. Two gasket modules are used for more complex circuits. Circuit Boards produce a smaller circuit package at lower cost; increased tamper resistance; and provide a clean, neat assembly.

Function Base Assembly Method: A Function Base can be used when circuits require four or less elements. This consists of a gasket module, a thin metal plate and a porting strip. Interconnections between the elements are cut into the module. The porting strip has 1/8" NPTF ports, eliminating the need for porting blocks. This method can be mounted on any flat surface; it provides a neat, durable assembly; and it increases tamper resistance.

Back Tubulation Construction: This method uses a thin metal plate (base plate) and porting blocks for each element. Each block has built in fittings for 5/32" (4mm) tubing. Element interconnections are made by connecting tubes to these fittings. Back tubulation is often used for "bread boarding" new circuits, air circuit training and if circuits are frequently changed.

Circuit Board Construction

Back Tubulation

# rformance Specifications

# Air Supply Preparation

**Recommended Filtration:** Filter air with a 40 micron filter or better. Additional screens in the base of timing function elements and amplifiers prevent large particles from entering the element.

Recommended Lubrication: None required for individual elements, or for circuits including timing functions or amplifiers.

Moisture: All metal parts are chromate plated to resist corrosion from moisture and many chemicals. A dry air supply is recommended for maximum repeatability of timing and sensing functions.

#### Operating Air:

Operating Pressure: 30-150 PSI (2-10 bar). Two-hand antitie-down devices require 50-125 PSI (3.5-9 bar).

#### Shift Pressures:

Snap-Acting Elements (And, Not, Inhibitor, S/R -- Mem, Delay and Pulse) shift when the pilot pressure exceeds 70% of the supply. They return when pilot pressure is less than 40% (Inhibitor 5%) of the supply.

Non-Snap-Acting Elements (Or -- Flip-Flop) have a shift pressure of 50% of supply pressure.

#### Flow & Cv Factors:

Dependent on specific elements and flow paths. Flow = 9.3-16.2 SCFM, Cv = .14-.28

#### Identification:

Symbols: Each element has a symbol based on the National Standard for diagramming moving part logic control (attached method).

Port Identification: Letters cast into the cover and base of each element correspond to input and output designations.

Mounting: Elements have 5/8" (15.9mm) bolt extensions. All mounting hardware and seals are provided with each element.

Test Ports: Many elements have 1/8" NPT ports connected to the "C" (output) port. These can be used as optional output ports, or as test ports.

#### Anticipated Life:

Element Life: APLC elements have proven extremely durable, operating many millions of cycles, or several years, without failure. If needed, repair kits or parts are available for most elements.

# eatures

- Ideal for machines where position of operator's hands must be monitored.
- Actuate and hold both air valve buttons concurrently to maintain an output air signal. If either push button is released, the output air signal is exhausted, indicating the operator's hands are no longer in position.
- Operating Pressures: 50-125 PSI (3.5-8.6 bar). Designed to comply with OSHA regulations.
- See page 32 for additional information on hooking up 59191 signal elements.

Warning: These provide only the anti-tie down logic function and are not stroke limiting devices. On machines with full revolution clutches and/or where repeat cycles can occur, approved safety and/or single stroke devices must be used in conjunction with the anti-tie down units.

#### **Elements**

#### 59191 Base Mounted

- Element has three 1/8" NPTF ports on top. 2 inputs, 1 output.
- Element is base mounted.

#### 59192 Circuit Board Mounted

- Occupies six (6) element spaces, 2 x 3 on circuit board. Not designed for back tubulation construction.
- Element has two 1/8" NPTF input ports on top, one O-Ring sealed output port to circuit board.

**Ordering Information:** Order push button valves separately.

# **Packages**

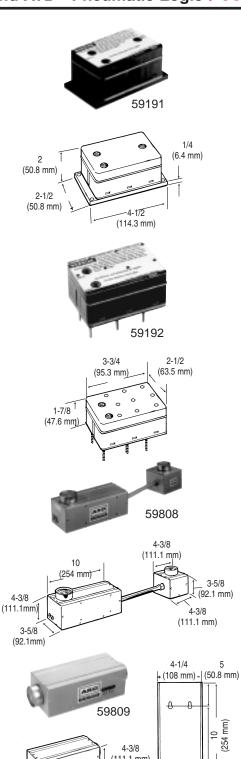

#### 59808

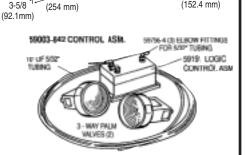

- Includes two enclosures with green push button valves separated by a length of flexible conduit. External supply and output to machine is made by 5/32" (4mm) instant tube fittings.
- Comes assembled with all internal connections ready to install on machine.
- Palm Buttons are 30" center to center.

- Green push buttons located on opposite ends of a single enclosure. External supply and output to machine is made by 5/32" (4mm) instant tube fittings.
- Comes assembled with all internal connections ready to install on machine.

#### 59003-842

- Unassembled package.
- Includes 59191 anti-tie-down block, two 461-3 palm buttons with 20975 guards, 10 feet of 5/32" tubing and fittings for 59191.
- Customer can custom fit components to machine.

(152.4 mm)

10

3-5/8

# 59860 Signal Standardizer

- Converts an input signal of any duration into a timed output signal.
- Built in 4-way function in which two output signals are provided; one normally on, the other normally off.
- Can be used for 3-way and 4-way valves of all types including single and double pilot-operated models.
- Timing Range is 0.1 to 3 seconds. Longer with use of an accumulator.
   Each additional cu. in. of space added will give an extra 8 seconds of timing.
- Use filtered, dry, non-lubricated air. 40-125 psi (2-10.4 bar)
- See page 32 for additional information.

#### 59861 Oscillator Circuit

- Use in applications involving cycling and oscillating valves and cylinders for manufacturing and testing; as well as, pumping, sorting & painting.
- Has two dial timers so both phases can be adjusted independently.
- Can be used for all types of 3-way and 4-way valves.
- Recommended Timing Range of .1 to 3 seconds. Longer when using an accumulator. Each additional cu. in. of space added will give an extra 8 seconds of timing.
- See page 32 for additional information.

**NOTE:** For set-up or trouble-shooting, time delay functions can be adjusted far beyond their recommended range; however, if their normal operating time is longer than 3 seconds, additional volume should be connected to the port marked "Acu" (to the right of the adjustment dial). Each cubic inch additional volume connected to this port will increase the maximum range of the time delay by 8 seconds. A pressure gauge tee'd into the accumulator port can be very valuable as a visual aid when adjusting timers with extended ranges.

#### 59917 Binary Flip-Flop

- With supply on, output one or output two will be on and the other off.
- Pressurizing the trigger port switches the outputs between on and off.

NOTE: All Flex-6 units have 10/32" ports.

# In Line Logic Elements

#### 59914 "OR" Element

 Connects two inputs to one output. The output will be on when either, or both, inputs are on.

#### 59913 "AND" Element

 Connects two inputs to one output. The output will be on when both inputs are on.

Operating Pressure: 30-150 PSIG (2-10 bar)
Operating Temperature: 32°-160°F (0°-71°C)

Ports: #10-32 threads
Body Material: Acetal Resin
Flow: "OR" = 4 SCFM
"AND" = 3.2 SCFM

Shuttle/Poppet: Buna N
Inserts: Aluminum
Cv: "OR" = .11
"AND" = .09

## Dimensions for Base Mounted Units Ports are 10/32 Threads

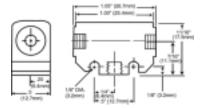

59914

59913

#### Flex 6

#### **Designed to Control Sequential Type Machines**

- Simplifies design & installation of control circuits.
- Circuit changes or additions can be accomplished in seconds.
- Very economical for simple air operated machines and fixtures.
- Ideal for harsh and explosive environments.
- All ports are 10/32 threads.

**Set/Reset Memory:** The first step in each Flex-6 circuit is controlled by a set/reset memory. A momentary start signal pressurizes the set port, causes the memory to go on and starts the sequence. The memory remains on until the reset port is pressurized (end of cycle or emergency stop). Loss of supply pressure also resets the memory (output off).

Automatic Reset Memory: Other Flex-6 memory functions automatically reset. A momentary signal at the set port causes the memory output to go on, provided the previous stage is on. The output will remain on until the entire circuit is reset. This memory has the ability to ignore signals arriving at the wrong time and will reset regardless of the set input condition. You don't need to analyze if the set signal is momentary or maintained, nor are you required to connect limit valves in series with a previous output.

**Timer Adjustment:** Each time delay has a numbered dial (the numbers act as reference only). Screwdriver adjustment and fixed delay models are available on special order.

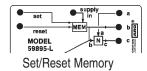

Adjustment Range: The recommended adjustment range is .1 to 3 seconds. If normal operating time is longer than 3 seconds, additional volume should be connected to the port marked "ACU." Each cubic inch additional volume connected to this port increases maximum time delay by 8 seconds.

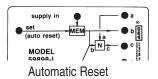

Sequence Controlled with Input Signals: If all steps are started by input signals, use one 59897 start/stop unit and an additional 59898 unit as required to complete the sequence.

Sequence Controlled by Time Delay Functions: If all steps are started by time delay (with the exception of the start button) use one piece 59895 start/stop unit and an additional 59896 to complete the sequence.

Both Input, Inhibit and Time Delay used to Control a Sequence: Mixed circuits are easily accomplished by selecting from the units previously mentioned, plus two more. Models 59899 and 59900 provide a combination of a time delay and an input signal functions in a single unit. Using the 59899 and 59900 gives you the exact unit needed for all mixed circuits.

**Inhibitor:** Inhibitor models (59920 through 59925) are used as the first, second or later circuit, depending on the application requirements. Inhibitors can be used to sense position of a cylinder, or other actuator, when limit switches are not appropriate.

Timer Adjustment

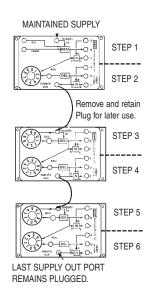

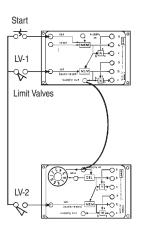

## **Steps to Connecting Flex-6 Units**

- 1. Arrange the units in the order and sequence they are used (steps 1 & 2 top, 3 & 4 next, etc.).
- 2. Connect a maintained supply to the "supply in" port of the first unit. Then connect the "supply out" of the first unit to the "supply in" of the second unit. Connect subsequent units in this manner. The last "supply out" port will remain plugged.

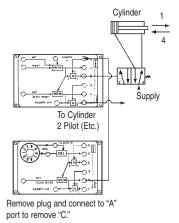

Connect the set input signals. The start signal and all other input signals are connected to the set ports of the units they will start.

4. Connect and "program" the outputs. Each unit has three ports on the right side marked "A," "B," and "C." The "C" port is the output and is connected to the pilot valve or other device causing action for each stage. The "C" output signal can be removed by a signal (maintained) to the "A" port. The "B" ports are used to provide this maintained signal.

Example: Cylinder 1 extends in step 1 and retracts in step 4. The "C" port of step 1 is connected to a spring return pilot valve which extends the cylinder. The "B" port of step 4 is connected to the "A" port of step 1. This accomplishes the retract function.

**NOTE:** Once these connections have been made, plug all "B" and "C" ports not used. "A" ports not used remain open.

5. Connect the reset signal from the last step in sequence to the port marked "reset" in the first. This signal resets the circuit, making it ready to start a new cycle.

All Ports are 10/32 Threads

#### **Individual Units**

#### 59895 S/R Mem-Delay Model

The first unit in a Flex-6 circuit when step two is a delay function. The first output is caused by the start input signal. The second output is caused by a time delay following the first output.

Flex 6 Dimensional Data is located on Pg.18.

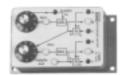

59895

#### 59896 Double Delay

Used as the second unit, or later, in circuits when two time delay functions are needed. The first output is caused by a time delay after the supply signal is applied. The second output is caused by a time delay following the first output.

Flex 6 Dimensional Data is located on Pg. 18.

59896

#### 59897 S/R Mem-Auto Mem Model

The first unit in Flex-6 circuits when step two is an input signal. The first output is caused by the start input signal. The second output is caused by a second input signal.

Flex 6 Dimensional Data is located on Pg. 18.

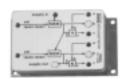

59897

#### 59898 Double Auto Mem Model

Used as the second unit, or later, in circuits when two input signals are available. Both outputs are caused by their respective inputs and both are controlled by automatic reset memory functions.

Flex 6 Dimensional Data is located on Pg. 18.

59898

#### 59899 Auto Mem-Delay Model

Used as the second unit, or later, in Flex-6 circuits when an input signal and a delay function are required. The first output is caused by an input signal. The second output is caused by a time delay following the first output.

Flex 6 Dimensional Data is located on Pg. 18.

59899

#### 59900 Delay-Auto Mem Model

Used as the second unit, or later, in circuits when a delay and an input signal are required. The first output is caused by delay function after the supply signal is applied. The second output is caused by an input signal.

Flex 6 Dimensional Data is located on Pg. 18.

59900

#### **Individual Units**

#### 59919-1 Cycle Repeat Circuit

Cycle Repeat Circuit provides continuous recycling of a control circuit started by a momentary start signal, end of cycle stop — momentary input, single cycle operation, emergency stop and an adjustable dwell between cycles.

Add to any Flex-6 circuit so it cycles continuously.

Flex 6 Dimensional Data is located on Pg. 18.

See page 33 for additional information.

#### 59920 S/R Mem-Inhibitor Model

The first Flex-6 circuit when step two is an inhibitor function. The first output is caused by the start input signal. The second output is caused by the release of pressure on the inhibitor port. Flex 6 Dimensional Data is located on Pg. 18.

#### 59921 Inhibitor-Input Model

Used as the second or later circuit when the first stage will be controlled by an inhibitor signal and the second from a pressure signal.

Flex 6 Dimensional Data is located on Pg.18.

#### 59922 Delay-Inhibitor Model

Used as the second or later circuit when the first stage will be controlled by a delay and the second from an inhibitor signal. Flex 6 Dimensional Data is located on Pg. 18.

#### 59923 Double Inhibitor Mem Model

Used as the second or later circuit when both stages are started by inhibitor signals.

Flex 6 Dimensional Data is located on Pg. 18.

#### 59924 Input-Inhibitor Model

Used as the second or later circuit when the first stage will be controlled by a pressure signal and the second from an inhibitor signal.

Flex 6 Dimensional Data is located on Pg. 18.

#### 59925 Inhibitor-Delay Model

Used as the second or later circuit when the first stage will be controlled by an inhibitor signal and the second from a delay. Flex 6 Dimensional Data is located on Pg. 18.

59924

59925

# **Ill**ustration 1

## **Description**

Here we have a two step sequence using one cylinder. When a push button is actuated, the cylinder will extend for an adjustable period of time. When the time has elapsed, the cylinder will retract to its original position.

#### Connections

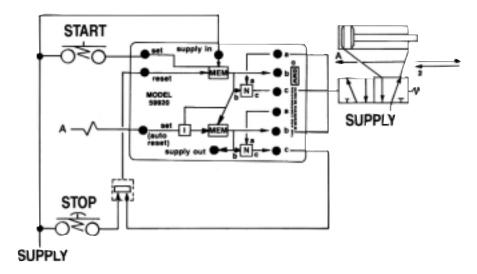

- A. This sequence uses a model 59895 Flex-6 unit.
- B. Supply is connected to the "Supply In" port.
- C. The output of a start push button is connected to the "Set" input port.
- D. The step 1 output (top "c" port) is connected to the pilot port of the valve which will extend the cylinder.
- E. The step 2 output (lower "c" port) is connected to the "Reset" input port.
- F. Both "b" ports, the "Supply Out" port, and the "ACU" port are plugged (new units are shipped with these plugs installed.)
- G. "a" ports, not used, remain open.

- 1. At rest, the cylinder is retracted.
- 2. The operator presses the start push button. This signals the set port and step 1 output goes on immediately. The cylinder extends and the time delay is started. At this point the signal is "Locked In" and the operator can release the start push button. The time delay is adjustable. Turning the dial clockwise, extends the time setting.
- 3. When the adjusted time is expired, step 2 output goes on. Step 2 output signals the reset port. This causes the Flex-6 unit to reset\* (unlocks the start signal) and outputs 1 and 2 go off., causing the cylinder to retract.
- 4. The circuit is now reset and ready for a new cycle when the start push button is again actuated.

<sup>\*</sup>Set signal must be off for this to take place.

# **Mustration 2**

# **Description**

Here we have a two step sequence described in Illustration 1. The difference is that the extension of the cylinder is sensed by the inhibitor element built into the 59920 Flex-6 unit. Again, when the cylinder is fully extended, the cylinder will retract.

#### Connections

- A. This sequence uses a model 59920 Flex-6 unit.
- B. The "A" connection is made from between the valve and the cylinder to the second set input.
- C. All other connections are identical to those made in Illustration 1, except that we have added a connection from "b" of step 2 to "a" of step 1. This will make the cylinder retract even if the operator continues to hold the button.

# **Options**

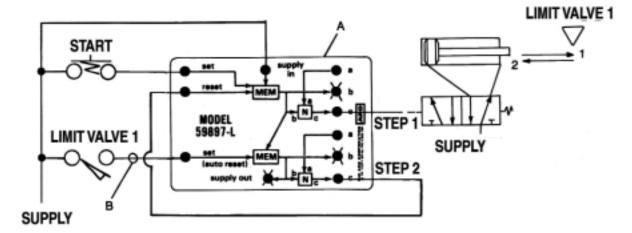

The additional connection from the "b" port of the second stage at the "a" port of the first stage insures that the cylinder will return even if the operator continues to hold the start button.

An emergency stop push button has also been added. If the operator presses the emergency stop button, the circuit will reset and both cylinders will retract.

- 1. At rest, the cylinder is retracted.
- 2. The operator presses the start push button. This signals the set port and step 1 output goes on. The operator can now release the start button.
- 3. The cylinder now extends, and when fully extended or stopped mechanically, the signal at the second set port is fully released. This causes the step two output to go on retracting the cylinder and resetting the circuit.

# **Ill**ustration 3

# **Description**

Here we have a two step sequence described in Illustration 1. The difference is that this cylinder actuates a limit valve when it is fully extended. The limit valve signals the Flex-6 unit that the cylinder is extended and it is time to retract.

#### **Connections**

- A. This sequence uses a model 59897 Flex-6 unit.
- B. The limit valve output is connected to the port marked Set (Auto Reset)
- C. All other connections are identical to those made in Illustration 1.

# **Options**

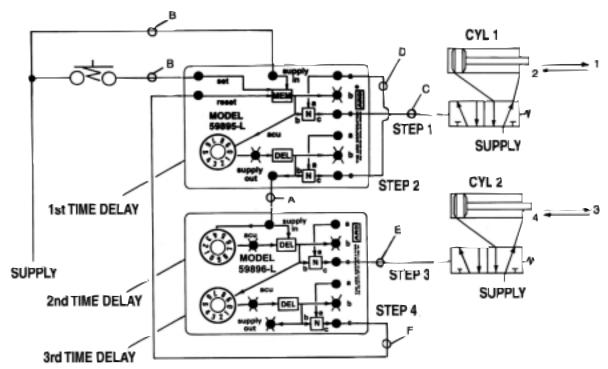

Option A, preventing the operator from holding the cylinder extended and Option B, providing an optional retract push button could be added to this circuit. These options are described in Illustration 2.

- 1. At rest, the cylinder is retracted.
- 2. The operator presses the start push button. This signals the set port and step 1 output goes on immediately. At this point, the signal is "Locked In" and the operator can release the start push button.
- 3. The cylinder actuates the extend limit valve (LV-1). Limit valve 1 signals the step 2 set port. This causes the step 2 output to go on immediately. The step 2 output signals the reset port, which resets the circuit\* removing the step 1 and 2 outputs and allows the cylinder to retract.

<sup>\*</sup> Set signal must be off for this to take place.

# **Mustration 4**

# **Description**

Here we have a two cylinder four step sequence.

- 1. When the push button is actuated, cylinder 1 extends. This also starts the first time delay.
- 2. When the first time delay times out, cylinder 1 retracts. This starts the second time delay.
- 3. When the second time delay times out, cylinder 2 extends. This starts the third time delay.
- 4. When the third time delay times out, cylinder 2 retracts. This also resets the circuit.

#### Connections

This circuit uses a model 59896 Flex-6 unit.

- A. The 59896 is added to the circuit simply be removing the "Supply Out" plug in the 59895 and connecting this port to the "Supply On" port of the 59896.
- B. The supply and start push buttons are connected as before.
- C. The step 1 output is connected to the valve that extends cylinder 1.
- D. The step 2 output is connected to the "a" port of step 1.
- E. The step 3 output is connected to the valve that extends cylinder 2.
- F. The step 4 output is connected to the reset port.
- G. All "b" ports, all accumulator ports and the supply out of the 59896 are plugged.
- H. All "a" ports not used are left open.

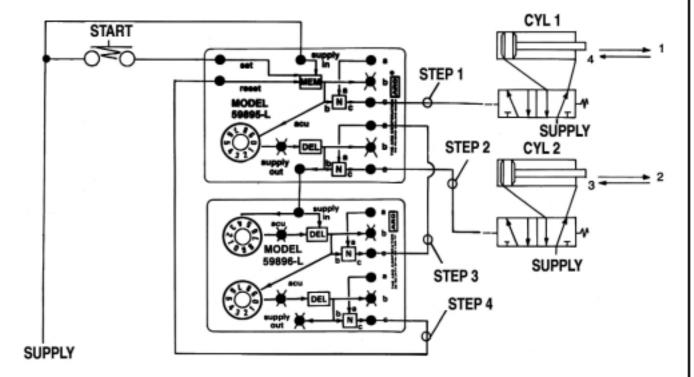

#### **Function**

Looking closely at the diagram on top of the Flex-6 units. you may be able to trace the signals as the sequence progresses.

- 1. When the operator presses the start push button the signal sets the memory (MEM) in the first unit (MEM output on). This goes thru a "not" (N) element and to the step 1 output (CYL 1 extends). The output from the memory element is also connected to the first time delay by a diagonal line.
- 2. The output of delay 1 again goes through a "not" element to provide the step 2 output. This output is connected externally to the "a" input of step 1 and internally to the "a" port of the "not" element. This removes the output signal at step 1 and retracts cylinder 1. The output of delay 1 is also connected to the second time delay via the "supply out" to "supply in" connection.
- 3. Time delay 2 extends cylinder 2 and starts time delay 3.
- 4. Time delay 3 outputs resets the entire circuit and in doing so retracts cylinder 2.

# **Ill**ustration 5

## **Description**

Here we have a circuit similar to the one shown in Illustration 4. The difference between these circuits is the sequence that the cylinders extend and retract. This is shown by the numbered arrows to the right of the cylinders.

#### **Connections**

Notice that the change in sequence is done entirely by changing the output connections on the right hand side of the Flex-6 units.

- A. Step 1 output is connected to the valve that extends cylinder 1 (as before).
- B. Step 2 output is connected to the valve that extends cylinder 2.
- C. Step 3 output is connected to the "a" input port of step 2. This removes the ste 2 output and retracts cylinder 2.
- D. Step 4 output is connected to the reset port (as before).

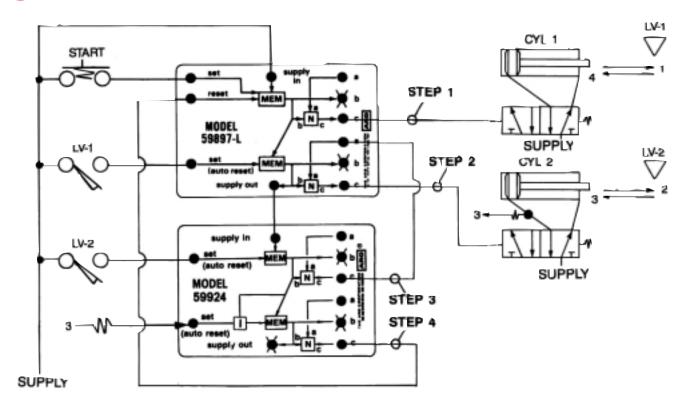

Thus by rearranging the output connections any sequence can be performed.

# **Options**

- 1. To prevent the operator from holding cylinder 1 extended (by holding down the start push button), a connection can be made from the "b" port of step 4 to the "a" port of step 1.
- 2. An emergency retract push button can be added (See Illustration 2).
- 3. Additional accumulator and/or gauges can be added to each time delay (See Illustration 2).
- 4. Sequence step indicators can be added to the "b" ports (Model 59907-004).

# **Ill**ustration 6

# **Description**

This circuit is identical to the one shown in Illustration 5 except this circuit uses input signals and inhibitor function, rather than time delays, to start each step. The input signals come from limit valves that are mounted to detect the movement of each cylinder.

#### **Connections**

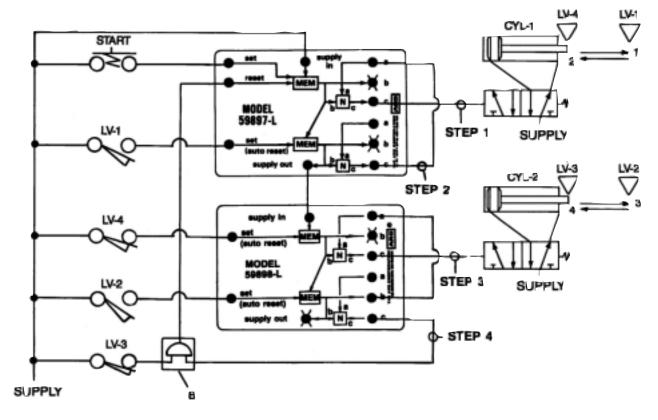

This circuit uses a 59897 and a 59924 Flex-6 unit. The output signals, the start signal and the supply are identical to those in Illustration 5. Three limit valves are mounted on the machine to detect the various cylinder positions. These positions are shown as triangles to the right of the cylinders. The same limit valves are shown again to the left of the Flex-6 circuit. They are connected to the Flex-6 circuit as follows:

LV-1 to the set port of Step 2 LV-2 to the set port of Step 3 Signal 3 to the set port of Step 4

- 1. At rest both cylinders are retracted.
- 2. When the operator actuates the start push button step 1 output goes on and cylinder 1 extends.
- 3. Cylinder 1 actuates limit valve one when fully extended. Limit valve one signals step 2 and step 2 output extends cylinder 2.
- 4. Cylinder 2 extends actuating limit valve 2 when it is fully extended. Limit valve 2 signals step 3 and step 3 output goes on. Step 3 output is connected to the "a" port of step 2. This removes the step 2 output and cylinder 2 retracts.
- 5. Cylinder 2 releases limit valve 2 then it retracts. When cylinder #2 is retracted, the pressure in line from valve to cylinder #2 drops to 0 PSI, ("A" port of inhibitor) and output 4 comes on. Step 4 output resets the circuit and cylinder 1 retracts.

# **Description**

This is the same sequence as shown in Illustration 4 except that limit valves are used to signal the start of each step. Two options (A & B) have also been added to the circuit.

- Option A cancels step 3 output and retracts cylinder 2 when output 4 comes on.
- Option B resets the circuit only after cylinder 2 if fully retracted.

#### **Notes**

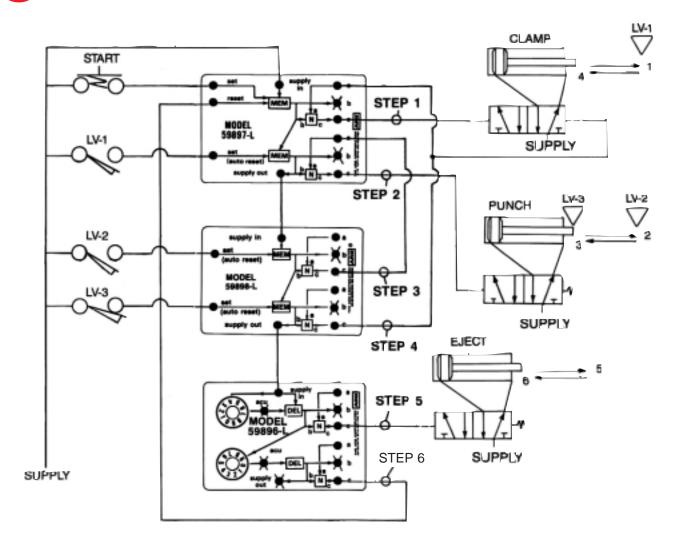

The output connections and the input connections were changed from Illustration 6 to accomplish this sequence. Limit valve 4 was added so that each position of each cylinder could be detected. Step 5 is accomplished by "anding" step 4 output and the final limit valve input (LV-3). Using a 59913 in line "and" function. This could also be done by a series connection through limit valve 3.

This option is often used when each step of the sequence must be monitored closely. Example: continuous operating circuits.

- 1. Operator actuates start push button. Cylinder 1
- 2. Cylinder 1 releases limit valve 4 and actuates limit valve 1. Step 2 output goes on retracting cylinder 1.
- 3. Cylinder 1 releases limit valve 1 and actuates limit valve 4. Step 3 output goes on extending cvlinder 2.
- 4. Cylinder 2 releases limit valve 3 and actuates limit valve 2. Step 4 output goes on retracting cvlinder 2.
- 5. Cylinder 2 releases limit valve 2 and actuates limit valve 3. Circuit resets and is now ready for a new cycle.

# **Illustration 8**

# **Description**

Here is a six step sequence involving three cylinders. The sequence is as follows:

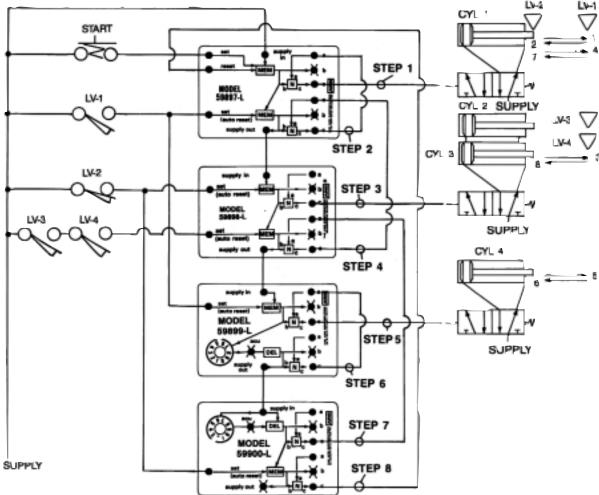

- 1. Operator actuates start push button. Clamp cylinder extends.
- 2. Clamp cylinder actuates limit valve 1. Punch cylinder extends.
- 3. Punch cylinder releases limit valve 3 and actuates limit valve 2. Punch valve retracts.
- 4. Punch cylinder releases limit valve 2 and actuates limit valve 3. Clamp cylinder retracts. Time delay 1 starts.
- 5. Time delay 1 times out. Eject cylinder extends, time delay 2 starts.
- 6. Time delay 2 times out. Eject cylinder is retracted and circuit is reset.

#### **Variations**

- 1. Both the 59898 (double input) and the 59896 (double timer) units are used in the same circuit.
- 2. This circuit also includes a double pilot valve on the clamp cylinder. Notice that the return pilot signal is simply tee'd from the signal that removes the step 1 output.

# **Ill**ustration 9

# **Description**

The circuit in Illustration 9 shows several additional features of Flex-6 circuits.

- 1. Flex-6 circuits can include as many steps as necessary to complete the sequence. Additional Flex-6 blocks are simply added by connecting the "supply out" port of previous steps to the "supply in" port of new steps. Here we have 4 Flex-6 units providing 8 separate steps in the machine sequence.
- 2. We are also showing two new Flex-6 assemblies not previously shown. They are models 59899 and 59900 and are used in circuits such as this where some of the steps are controlled by timers and others by input signals.
- 3. Notice cylinders 2 and 3. When two cylinders work together their actions can be controlled by one step in the sequence. The only added provision here was to make sure both cylinder had fully extended before step 4 could take place. For this we provided limit valves 3 and 4. They can be connected in series (as shown) or "anded" together using a 59913 in line "and" function.
- 4. This drawing also shows a cylinder (cylinder 1) being extended and retracted twice in the sequence. First note how this is accomplished on the output side. Step one comes on and is later cancelled by step 2. Still later in the sequence step 4 output comes on, cancels step 2 and this allows step 1 to come back on. Finally step 7 comes on, cancels step 4, releasing step 2 and cancelling step 1. Notice also that limit valve 1 and 2 outputs can be used more than once in the same circuit. Simply tee their outputs and connect to the stage start ports indicated.

# Ther Six Element Assemblies

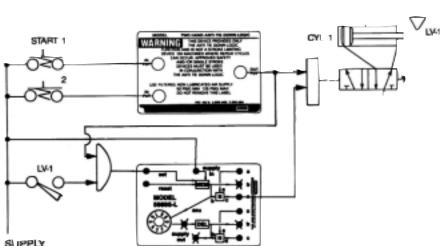

Four other six element assemblies are available. These units are sometimes used with Flex-6 circuits and in other cases provide a complete function in themselves.

#### Two-Hand Ant-Tie-Down Model 59191

The two-hand anti-tie-down is used to insure that both push buttons have been actuated before the cycle will start. When the anti-tie-down is used, both buttons must be actuated concurrently to create an output signal. Once either push button is released, the output signal goes off. Both push buttons must then be released and reactuated to start again.

The first drawing shows a twohand anti-tie-down added to the start of a Flex-6 circuit.

The second drawing shows a more complex circuit which is used to insure that the operator hold both buttons until cylinder 1 is fully extended. Once cylinder 1 is extended and actuates limit valve 1, the push buttons can be released and the machine will continue its automatic cycle.

START 1

SUPPLY

# The Signal Standardizer Model 59860

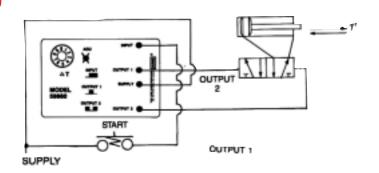

The 59860 signal standardizer (or signal shaper) can be used to convert a signal of any duration to outputs of a predetermined time period.

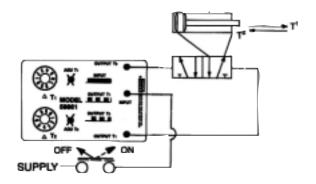

When the start signal is received, the cylinder will extend for the period of time adjusted on the timer. Then the cylinder will retract. The start input signal can be shorter or longer than the output signal(s)\* without affecting the timing function.

#### The Oscillator Circuit Model 59861

When a signal is received at the input of the osciallator circuit output T1 will come on. After an adjustable period of time (adjustable at timer T<sup>1</sup> output T<sup>1</sup> will go off and output T<sup>2</sup> will go on.\* After another adjustable period of time (adjustable at T2) output will go off and output T<sup>1</sup> will go on. This will continue as long as the input remains on.

\* Outputs not used can be plugged. Small cylinders can be ported directly to these outputs.

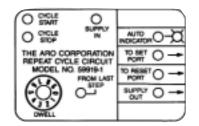

# Cycle Repeat Circuit

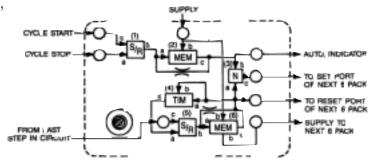

# **Cycle Repeat Circuit Model 59919-1**

This circuit is designed to replace the 59003-099 cycle repeat circuit.

The cycle repeat circuit shown can be added to any Flex-6 circuit so that it will recycle continuously. The circuit contained in this assembly is shown at the right.

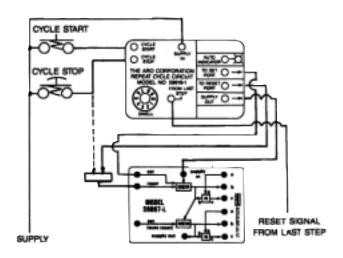

- 1. The cycle repeat circuit provides for:
  - A. Continuous recycling of a control circuit, started by a a momentary start signal.
  - B. end of cycle stop momentary input.
  - C. An adjustable dwell between cycles.
  - D. Single cycle operation.
  - E. Emergency stop.

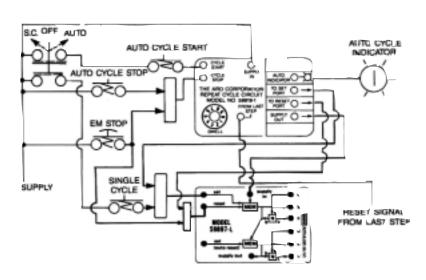

The illustration at right shows a cycle repeat circuit connected in its simplest form. Actuation of the start push button starts the circuit to run in an auto-recycle mode. When the cycle stop push button is actuated the circuit will complete that cycle and will not start the next cycle. If you want the cycle to stop immediately, add the connection shown by the dotted line.

The illustration at right shows a more complex application of the cycle repeat circuit. Here we have provisions for either single cycle or automatic cycling and an auto cycle indicator. The circuit can be stopped either at the end of the cycle (with the auto cycle stop push button) or immediately (with the emergency stop button).

#### **Individual Elements**

#### 59010 "OR" Element

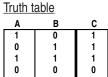

#### 59023 "OR" Element on 1/8" Base

- Combines two air signals so either can produce an output.
- Output port C is pressurized when either input port A or B is pressurized "on".

Dimensions: 1 1/4" sq. x 1" (31.8mm sq. x 25.4mm) Response Times: Input to Output Milliseconds

"A" on to "C" on

"B" on to "C" on 7

## 59111 "AND" Element 59124 "AND" Element on 1/8" Base

- Combines two signals so both must be on to create an output.
- Output port C is pressurized only when both inputs A & B are pressurized "on".
- Can be used with timer elements to produce time-delay functions.
- Shifting is snap-action when input at "A" port increases to 70% of pressure at "B" port. Return when "A" decreases to 40% of "B".

Dimensions: 1 1/4" Sq. x 1 21/32" (31.8mm sq. x 42.1mm) Response Times: <u>Input to Output</u> <u>Milliseconds</u>

59800

#### 59800 Inhibitor Element

#### 59912 Inhibitor Assembly on 1/8" Base

- Functions as NOT element except pressure at A must drop below 5% of supply before element will reset, regaining output at C.
- Useful in detecting air cylinder motions where limit valves cannot be applied.

Response Times: <u>Input to Output</u> <u>Milliseconds</u>

A on to C off 15 A off to C on 25

#### 59181 Set-Reset (S-R) Gate and 59113 Memory Models 59185 Set-Reset (S-R) Gate and Memory Assembly on 1/8" Base

- The elements work together to perform a memory function.
- With constant supply at B of MEM and B of S-R connected to A of MEM, a momentary pressure signal at C of S-R will cause C of MEM to pressurize. C of MEM will remain pressurized until a pressure signal to A of S-R is received.
- The MEMORY is pneumatically retained. If supply is removed (B MEM off), output C will go off & remain off until a new set signal is received.
- The reset signal ("A" of S-R) is snap-action function and can be connected to a TIMER element to create a delayed reset function.

Dimensions: 1 1/4" sq. x 1 21/32" (31.8mm x 42.1mm)

Minimum Time: Milliseconds Signal

To SET 17 To RESET 19

Dimensions for Base Assemblies are on page 40.

# Flip-Flop

### 59892"FLIP FLOP" Model

- A memory type element, Flip-Flop converts momentary signals received at the set and reset ports into maintained corresponding outputs.
- A set signal at A shifts the Flip-Flop to C port on and resets D to off. A reset signal at F shifts the Flip-Flop to D on and C off.
- If set or reset signals are maintained, later signals of equal pressure to the opposite input will not alter the output condition.
- The Flip-Flop has six ports and requires two element spaces.

A Set Input D Reset Output B Supply E Supply C Set Output F Reset Input

**Approximate Response Time** 59892 has two top ports (10-32) for C & D outputs. Input to Output Milliseconds Shift pressure is 50% of supply pressure. A on to C on 11 Dimensions: 2 1/2" x 1 7/32" (63.5mm x 36.5mm) F on to D on 11

# **Delay Elements & Assemblies**

### **DELAY ELEMENTS**

- Combine an AND and a TIMER function.
- With supply present at B, output will be pressurized (C on) a predetermined amount of time after input A is pressurized. Time can be fixed or adjustable.
- Reset time (time signal at "A" must be off between cycles) is 100 milliseconds.
- Timing ranges for individual elements cannot be increased. For longer delays, a base mounted assembly is needed.

### **DELAY TIMING IN FUNCTIONS**

- 1. With the input off, the output will also be off.
- 2. The timing function starts when the input goes on.
- 3. When the timing is complete, the output goes on.
- 4. Output goes off immediately when input is removed.

59166-4

# **Pulse Elements & Assemblies**

### **PULSE ELEMENTS**

- Combine a NOT and a TIMER function.
- These perform TIMING-IN inverted or PULSE functions, depending on connections to supply port B.
- **For TIMING-IN INVERTED function:** With port B pressurized, C port remains on until port A is pressurized. When A is pressurized, C will go OFF after a predetermined amount of time.

**PULSE function:** When A & B are connected together, output C is normally off. If inputs are applied to A & B, output C goes on. C remains on for timer period, then goes off and remains off until inputs are removed and reapplied. Reset time is 100 milliseconds. The predetermined amount of time can be fixed or adjustable.

- 1. With input off, the output will also be off.
- 2. Output goes on & timing starts when input comes on.
- 3. When timing is completed, output goes off.
- Remove & reapply input to get second output.
   NOTE: Input must be longer than output for full times signal. If not possible, see momentary timers.

## **Timer Elements**

TIMERS are used in conjunction with snap-acting 59111 AND, 59112 NOT, 59181 S-R GATE or 59800 INHIBITOR to perform special functions not offered in one complete element.

- Overall height of circuit board can be reduced by using these combinations rather than elements which combine these functions.
- Timing periods can exceed 7.5 seconds when using with 59117 Accumulators.
- Time can be fixed or adjustable, depending on element selected.

### 59115 Screw Adjustable Timer

• Connected to A of snap-acting AND or NOT element, these timing ranges can be accomplished.

Dimensions: 1 1/4" sq. x 2 7/64" (31.8mm sq. x 53.6mm)

# **NOT Amplifier**

### 59176 NOT Amplifier

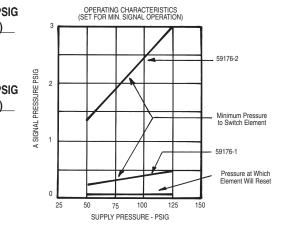

- The element converts low pressure signals such as those used in liquid level sensing, to high pressure signals compatible with other APLC elements.
- Performs NOT function with exception when C output is greater than input of A<sub>1</sub>.
- Input A & B ports must be interconnected externally of element.
- Output C is on only when low pressure at A<sub>1</sub> is off. C output equals pressure at A & B.
- Shift pressure depends on element ordered and adjusted setting.
- Sensitivity adjustment screw allows adjustment of shift point within adjustable range.

Start up B to C pulse	90	33.5

59089

### 59890 Vibrator Element 59866 Vibrator on 1/8" Base

- With input B on, C output will come on and go off in a constant timed pattern until the input is removed.
- The on and off times are not independently adjustable.
- Adjustment timing range: .08 to 7.5 seconds. Output off equals 80% of on setting.
- C port must also be connected to the A input port on element.

59890

### 20191 Circuit Board Mounted Poppet Valve

- 3-Way poppet with 1/4" ports. Plumb normally open (passing) or closed (non-passing.)
- Pilot signal port comes from any one of A, B, C ports on Circuit Cover Plate.
- Flow is 46.4 SCFM (21.9 dm<sup>3</sup>/s) at 90 PSI (6.3 bar) supply and 75 PSI (5.2) outlet.
   Cv Factor 1.3.
- Mounts directly to circuit board, utilizing space of one standard element. Must be mounted at periphery of circuit.

Dimensions: 1 15/64" x 1 1/2" x 2 31/32" (31.4mm x 38.1mm x 75.4mm)

20191

### 59891 Air to Electric Interface Device

- Normally open, single throw, single pole pressure switch.
- Mount to top of C port of standard element.

# **Porting Block**

### 59109 Porting Block

- Provides three instant tube fittings. One each to A, B or C ports of elements.
- One porting block required for each element.

59109

Dimensions for Base Assemblies are on page 40.

# **Mounting Equipment**

### 59200-XX Base Plate

- · Contains two mounting holes and three porting holes for each element.
- Surface is metallic grit etched and plated to resist corrosion.

### 59595-88 Module Gasket

• Corresponding circuit pattern of layout sheet is printed on module. Air channels are then cut into gasket for air passage.

### 59201-XX Cover Plate

- Used in conjunction with 59200 base plate to retain 59595 module.
- · Contains only the mounting holes required by elements.
- Surface is metallic grit etched and plated to resist corrosion.

### **Enclosures**

### 58060 Two Compartment Enclosure

- Accepts 6 x 6 element circuit board.
- Rear compartment provides access to terminal connections and back of circuit board.
- Pre-drilled pads for terminals and mounting rails.

Dimensions: 11 9/16 x 11 23/32" x 8 7/32" (294mm x 298mm x 209mm)

### 59097-6 Hinged Mounting Plates

- Accepts 6 x 6 element circuit boards.
- Provides mounting and swing-out of circuit boards.
- Requires 5/8" (15.9mm) clearance for circuit boards, 2 3/8" (60mm) for back tubulation.

58060

59097-6

### **Pneumatic Counters**

### **Totalizing Counters/Manual Reset**

### 59095-1 Knob Reset/Base Mount

- Counter advances one digit each time a pneumatic pulse is received.
- 600 counts/minute maximum.

### 59095-2 Dial Reset/Panel Mount

- Counter advances one digit each time a pneumatic pulse is received.
- 600 counts/minute maximum. Can also be base mounted.

### 59095-3 Key Reset/Panel Mount

- Counter advances one digit each time a pneumatic pulse is received.
- 600 counts/minute maximum. Can also be base mounted.

### **Specifications**

Operating Pressure: Operating Temperature: 30 to 150 PSIG (2 to 10 bar) 32° to 160°F (0° to 71°C)

Minimum Signal Duration: Ports:
Pressure Signal 0.05 sec. 1/8" NPTF

### **Totalizing Counter/Manual or Pressure Reset**

### 59801 Panel Mount 59836 Surface Mount

- 6-digit readout. Records up to 1500 counts/minute
- Can be reset using reset button or pneumatic signal.

### **Specifications**

Operating Pressure: Operating Temperature: 30 to 115 PSIG (2 to 8 bar) 32° to 140°F (0° to 60°C)

Minimum Signal Duration: Ports:

Pressure Signal .008 sec. 5/32" (4mm) Tube Fittings

Exhaust Signal .010 sec. Reset Signal .150 sec.

### **Predetermined Counter/Manual or Pressure Reset**

### 59802 Panel Mount

- 5-digit readout.
- Each pneumatic pulse decreases predetermined number by one until zero is reached. An output signal is then provided.
- Counter is reset to predetermined number by the reset button or a pneumatic signal.

### **Specifications**

Operating Pressure: Operating Temperature
30 to 115 PSIG (2 to 8 bar) 32° to 140°F (0° to 60°C)

Minimum Signal Duration: Ports:

Pressure Signal .008 sec. 5/32" (4mm) Tube Fittings

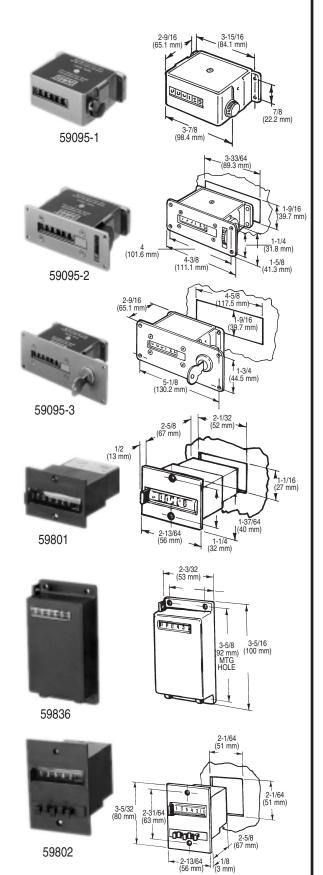

Exhaust Signal .012 sec. Reset Signal .180 sec.

4.5 SCFM (2.1 dm<sup>3</sup>/s)

Flow:

Port Designation:

P (3) Supply, A (4) Output, Z (1) Count, Y (2) Reset.

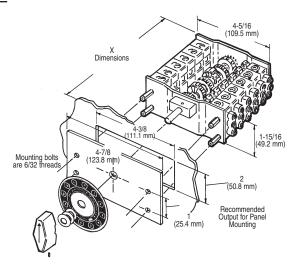

- Provides actuation of up to 12, 3-way valves in different positions.
- Each can be plumbed normally passing, normally non-passing, multipurpose, selector or any 2-way function.
- Cam lobes snap on in any of 12 positions.
- Available with 5/32" tube fittings or 1/8" ports.
- Pressure Range 30-150 PSI (2.1-10.4 bar)

59100-6XX	5-11/64 (131 mm)

# **Liquid Level Sensor**

- Sensors produce a pneumatic output signal as fluid levels in an unpressurized vessel rise or fall past predetermined levels. Will accurately sense almost any fluid.
- Supply pressure range: 30 to 150 psig. Range recommended for quickest response is 50 to 100 psig.
- When on, the output is the same pressure as that supplied to the air inlet. When off, the output is connected to atmosphere through an internal exhaust port. This insures a sharp on-off signal from the sensor.
- Units supplied with 25' of flexible 1/4" tubing.

### 59916-1 High Level Sensor

Provides an output signal when sensing tube is blocked by a liquid.

### 59916-2 Low Level Sensor

Provides an output signal when sensing tube is not blocked by a liquid.

59916-X

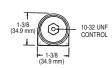

# **Pneumatic Sensing Components**

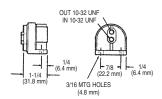

### 59807 Amplifier

**Y-Connector** 

- Designed to amplify low pressure signals from
- Actuates at signal pressures as low as one to four inches (249 to 995 Pa) of water.
